

# TESTOSTERONE -> androgen insensitivity syndrome

For clinical-collaborator outreach.

---

## *Why this hypothesis is real*

Drug-target convergence on the disease scores **0.84** (noisy-OR over OT target-disease associations). This pair is fully novel relative to all known drug-indication assignments in ChEMBL. Therapeutic direction is **aligned** with OT genetic evidence (the drug pushes the target the disease-protective way). Lead target is well expressed in the disease-relevant tissue (uterus). Orthologous-gene model-organism evidence is strong (phylo\_score 0.54, n=4).

## *Why now (IP runway + literature footprint)*

Loss-of-exclusivity year **2034**, with 34 generic ANDAs already on the market.

## *Clinical opportunity*

US population: approximately **166** patients -- below the 200,000 FDA Orphan Drug Act threshold. Orphan exclusivity + premium pricing changes the deal math materially. (source: Orphanet Annual incidence (<1 / 1 000 000, Denmark))

## *What we propose*

**BioBix** (Department of Mathematical Modelling, Statistics and Bioinformatics, Ghent University) brings bioinformatics support to the collaboration:

- Target validation across blood / immune / cancer multi-omics datasets
- Biomarker candidate identification from public + private cohorts
- Patient stratification analytics for trial-enrichment design
- Mechanism-of-action mining via systems-biology priors
- Quick-turn evidence syntheses for IIT and partnered programs

Proposed collaboration model:

- Investigator-initiated trial framework with the substance owner
- BioBix as bioinformatics analytics partner (target/biomarker/biostatistics)
- Joint publication strategy; data-sharing agreement gated on IP terms

## *Next step*

A 30-minute scoping call to align on feasibility. We would come prepared with a brief mechanistic dossier, an annotated literature pull, and a pilot biomarker shortlist for the disease.

**Wim Van Criekeinghe**, Professor (PhD, h-index 73)
